Calculus Summer Packet

Summer 2021

Dear Student,

Welcome to Sayreville War Memorial High School and your math course for the year! There is much to learn this year, and each class session during school will require students to work diligently, both during and outside of class. This summer math packet addresses the material that you should be comfortable with before the start of Calculus. This math packet serves 2 purposes:

1)   It will allow you to remain mathematically fresh during the summer and

2)   It will enable you to "hit the ground running" when this course begins.

This packet should be completed and brought with you on the first day of school. Use the answer key provided to check your work. The attached assignment includes all problems to be completed by the first day of school for Calculus. All of the problem types in the assignment should have been covered in your Precalculus course this year or in prior courses. If there is a problem which you do not remember how to complete, use your notes from Precalculus or videos on mathispower4u.com. If you have any questions about this assignment or the course, please feel free to contact me at any time over the summer. My email address is as follows: Jennifer.Vasquez@sayrevillek12.net.

This summer assignment is to enable us to learn actual Calculus in September and spend as little time as possible on reviewing Precalculus. It is for your own review and will help ease the transition into a more advanced course.

You will be assessed on this content within the first week or so of school.

Good luck!

Name:_____

FUNCTIONS

To evaluate a function for a given value, simply plug the value into the function for x.

Recall: $(f \circ g)(x) = f(g(x))$ OR $f[g(x)]$ read "f of g of x" Means to plug the inside function (in this case $g(x)$) in for x in the outside function (in this case, f(x)).

Example: Given $f(x) = 2x^2 + 1$ and $g(x) = x - 4$ find $f(g(x))$.

$$f(g(x)) = f(x-4)$$
$$= 2(x-4)^2 + 1$$
$$= 2(x^2 - 8x + 16) + 1$$
$$= 2x^2 - 16x + 32 + 1$$
$$f(g(x)) = 2x^2 - 16x + 33$$

Let $f(x) = 2x + 1$ and $g(x) = 2x^2 - 1$. Find each.

1. $f(2) = $ _____

2. $g(-3) = $ _____

3. $f(t+1) = $ _____

4. $f[g(-2)] = $ _____

5. $g[f(m+2)] = $ _____

6. $[f(x)]^2 - 2g(x) = $ _____

Let $f(x) = \sin(2x)$ Find each exactly.

7. $f\left(\dfrac{\pi}{4}\right) = $ _____

8. $f\left(\dfrac{2\pi}{3}\right) = $ _____

Let $f(x) = x^2$, $g(x) = 2x + 5$, and $h(x) = x^2 - 1$. Find each.

9. $h[f(-2)] = $ _____

10. $f[g(x-1)] = $ _____

11. $g[h(x^3)] = $ _____

INTERCEPTS OF A GRAPH

To find the x-intercepts, let y = 0 in your equation and solve.
To find the y-intercepts, let x = 0 in your equation and solve.

Example: Given the function $y = x^2 - 2x - 3$, find all intercepts.

$x - \text{int.} \ (Let \ y = 0)$
$0 = x^2 - 2x - 3$
$0 = (x-3)(x+1)$
$x = -1 \ or \ x = 3$
$x - \text{intercepts} \ (-1, 0) \ and \ (3, 0)$

$y - \text{int.} \ (Let \ x = 0)$
$y = 0^2 - 2(0) - 3$
$y = -3$
$y - \text{intercept} \ (0, -3)$

Find the x and y intercepts for each.

12. $y = 2x - 5$
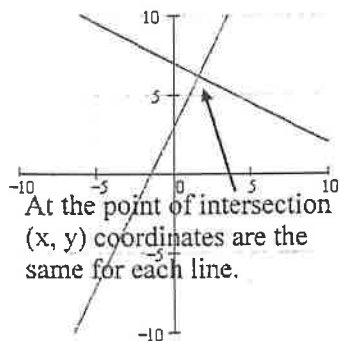

13. $y = x^2 + x - 2$

14. $y = x\sqrt{16 - x^2}$

15. $y^2 = x^3 - 4x$

5

POINTS OF INTERSECTION

Use substitution or elimination method to solve the system of equations.
Remember: You are finding a POINT OF INTERSECTION so your answer is an ordered pair.

At the point of intersection (x, y) coordinates are the same for each line.

CALCULATOR TIP
Remember you can use your calculator to verify your answers below. Graph the two lines then go to CALC (2nd Trace) and hit INTERSECT.

Example: Find all points of intersection of $\begin{array}{l} x^2 - y = 3 \\ x - y = 1 \end{array}$

ELIMINATION METHOD
Subtract to eliminate y
$x^2 - x = 2$
$x^2 - x - 2 = 0$
$(x-2)(x+1) = 0$
$x = 2$ or $x = -1$
Plug in $x = 2$ and $x = -1$ to find y
Points of Intersection: $(2,1)$ and $(-1,-2)$

SUBSTITUTION METHOD
Solve one equation for one variable.
$y = x^2 - 3$
$y = x - 1$
Therefore by substitution $x^2 - 3 = x - 1$
$x^2 - x - 2 = 0$
From here it is the same as the other example

Find the point(s) of intersection of the graphs for the given equations.

16. $\begin{array}{l} x + y = 8 \\ 4x - y = 7 \end{array}$

17. $\begin{array}{l} x^2 + y = 6 \\ x + y = 4 \end{array}$
18. $\begin{array}{l} x = 3 - y^2 \\ y = x - 1 \end{array}$

DOMAIN AND RANGE

Domain – All x values for which a function is defined (input values)
Range – Possible y or Output values

EXAMPLE 1

a) Find Domain & Range of $g(x)$.

The domain is the set of inputs $\cancel{out}$ of the function. Input values run along the horizontal axis. The furthest-left input value associated with a pt. on the graph is -3. The furthest right input values associated with a pt. on the graph is 3. So Domain is $[-3,3]$, that is all reals from -3 to 3.

The range represents the set of output values for the function. Output values run along the vertical axis. The lowest output value of the function is -2. The highest is 1. So the range is $[-2,1]$, all reals from -2 to 1.

EXAMPLE 2

Find the domain and range of $f(x)=\sqrt{4-x^2}$
Write answers in interval notation.

DOMAIN
For $f(x)$ to be defined $4-x^2 \geq 0$.
This is true when $-2 \leq x \leq 2$
Domain: $[-2,2]$

RANGE
The solution to a square root must always be positive thus $f(x)$ must be greater than or equal to 0.
Range: $[0,\infty)$

Find the domain and range of each function. Write your answer in INTERVAL notation.

19. $f(x)=x^2-5$

20. $f(x)=-\sqrt{x+3}$

21. $f(x)=3\sin x$

22. $f(x)=\dfrac{2}{x-1}$

INVERSES

To find the inverse of a function, simply switch the x and the y and solve for the new "y" value. Recall $f^{-1}(x)$ is defined as the inverse of $f(x)$

Example 1:

$f(x) = \sqrt[3]{x+1}$ Rewrite f(x) as y

$y = \sqrt[3]{x+1}$ Switch x and y

$x = \sqrt[3]{y+1}$ Solve for your new y

$(x)^3 = \left(\sqrt[3]{y+1}\right)^3$ Cube both sides

$x^3 = y+1$ Simplify

$y = x^3 - 1$ Solve for y

$f^{-1}(x) = x^3 - 1$ Rewrite in inverse notation

Find the inverse for each function.

23. $f(x) = 2x + 1$

24. $f(x) = \dfrac{x^2}{3}$

25. $g(x) = \dfrac{5}{x-2}$

26. $y = \sqrt{4-x} + 1$

27. If the graph of $f(x)$ has the point (2, 7) then what is one point that will be on the graph of $f^{-1}(x)$?

28. Explain how the graphs of $f(x)$ and $f^{-1}(x)$ compare.

8

EQUATION OF A LINE

Slope intercept form: $y = mx + b$

Vertical line: $x = c$ (slope is undefined)

Point-slope form: $y - y_1 = m(x - x_1)$
* LEARN! We will use this formula frequently!

Horizontal line: $y = c$ (slope is 0)

Example: Write a linear equation that has a slope of ½ and passes through the point (2, -6)

Slope intercept form

$y = \dfrac{1}{2}x + b$ Plug in ½ for m

$-6 = \dfrac{1}{2}(2) + b$ Plug in the given ordered

$b = -7$ Solve for b

$y = \dfrac{1}{2}x - 7$

Point-slope form

$y + 6 = \dfrac{1}{2}(x - 2)$ Plug in all variables

$y = \dfrac{1}{2}x - 7$ Solve for y

29. Determine the equation of a line passing through the point (5, -3) with an undefined slope.

30. Determine the equation of a line passing through the point (-4, 2) with a slope of 0.

31. Use point-slope form to find the equation of the line passing through the point (0, 5) with a slope of 2/3.

32. Use point-slope form to find a line passing through the point (2, 8) and parallel to the line $y = \dfrac{5}{6}x - 1$.

33. Use point-slope form to find a line perpendicular to $y = -2x + 9$ passing through the point (4, 7).

34. Find the equation of a line passing through the points (-3, 6) and (1, 2).

35. Find the equation of a line with an x-intercept (2, 0) and a y-intercept (0, 3)

UNIT CIRCLE
You can determine the sine or the cosine of any standard angle on the unit circle. The x-coordinate of the circle is the cosine and the y-coordinate is the sine of the angle. Recall tangent is defined as sin/cos or the slope of the line.

Examples:

$$\sin\frac{\pi}{2}=1 \qquad \cos\frac{\pi}{2}=0 \qquad \tan\frac{\pi}{2}=und$$

*You must have these memorized OR know how to calculate their values without the use of a calculator.

36.   a.) $\sin\pi$

b.) $\cos\dfrac{3\pi}{2}$

c.) $\sin\left(-\dfrac{\pi}{2}\right)$

d.) $\sin\left(\dfrac{5\pi}{4}\right)$

e.) $\cos\dfrac{\pi}{4}$

f.) $\cos(-\pi)$

g) $\cos\dfrac{\pi}{3}$

h) $\sin\dfrac{5\pi}{6}$

i) $\cos\dfrac{2\pi}{3}$

j) $\tan\dfrac{\pi}{4}$

k) $\tan\pi$

l) $\tan\dfrac{\pi}{3}$

m) $\cos\dfrac{4\pi}{3}$

n) $\sin\dfrac{11\pi}{6}$

o) $\tan\dfrac{7\pi}{4}$

p) $\sin\left(-\dfrac{\pi}{6}\right)$

TRIGONOMETRIC EQUATIONS

Solve each of the equations for $0 \le x < 2\pi$.

37. $\sin x = -\dfrac{1}{2}$

38. $2\cos x = \sqrt{3}$

39. $4\sin^2 x = 3$
    **Recall $\sin^2 x = (\sin x)^2$
    **Recall if $x^2 = 25$ then $x = \pm 5$

40. $2\cos^2 x - 1 - \cos x = 0$ *Factor

TRANSFORMATION OF FUNCTIONS

$h(x) = f(x) + c$	Vertical shift c units up	$h(x) = f(x-c)$	Horizontal shift c units right
$h(x) = f(x) - c$	Vertical shift c units down	$h(x) = f(x+c)$	Horizontal shift c units left
$h(x) = -f(x)$	Reflection over the x-axis		

41. Given $f(x) = x^2$ and $g(x) = (x-3)^2 + 1$. How the does the graph of g(x) differ from f(x)?

42. Write an equation for the function that has the shape of $f(x) = x^3$ but moved six units to the left and reflected over the x-axis.

43. If the ordered pair $(2, 4)$ is on the graph of $f(x)$, find one ordered pair that will be on the following functions:

   a) $f(x) - 3$ b) $f(x-3)$ c) $2f(x)$ d) $f(x-2)+1$ e) $-f(x)$

11

VERTICAL ASYMPTOTES

Determine the vertical asymptotes for the function. Set the denominator equal to zero to find the x-value for which the function is undefined. That will be the vertical asymptote <u>given the numerator does not equal 0 also</u> (Remember this is called removable discontinuity).
Write a vertical asymptotes as a line in the form x =

Example: Find the vertical asymptote of $y = \dfrac{1}{x-2}$

Since when $x = 2$ the function is in the form $1/0$ then the vertical line $x = 2$ is a vertical asymptote of the function.
44. $f(x) = \dfrac{1}{x^2}$

45. $f(x) = \dfrac{x^2}{x^2 - 4}$

46. $f(x) = \dfrac{2+x}{x^2(1-x)}$

47. $f(x) = \dfrac{4-x}{x^2 - 16}$

48. $f(x) = \dfrac{x-1}{x^2 + x - 2}$

49. $f(x) = \dfrac{5x + 20}{x^2 - 16}$

HORIZONTAL ASYMPTOTES

Determine the horizontal asymptotes using the three cases below.

Case I. Degree of the numerator is less than the degree of the denominator. The asymptote is $y = 0$.

Example: $y = \dfrac{1}{x-1}$ (As x becomes very large or very negative the value of this function will approach 0). Thus there is a horizontal asymptote at $y = 0$.

Case II. Degree of the numerator is the same as the degree of the denominator. The asymptote is the ratio of the lead coefficients.

Exmaple: $y = \dfrac{2x^2 + x - 1}{3x^2 + 4}$ (As x becomes very large or very negative the value of this function will approach 2/3). Thus there is a horizontal asymptote at $y = \dfrac{2}{3}$.

Case III. Degree of the numerator is greater than the degree of the denominator. There is no horizontal asymptote. The function increases without bound. (If the degree of the numerator is exactly 1 more than the degree of the denominator, then there exists a slant asymptote, which is determined by long division.)

Example: $y = \dfrac{2x^2 + x - 1}{3x - 3}$ (As x becomes very large the value of the function will continue to increase and as x becomes very negative the value of the function will also become more negative).

Determine all Horizontal Asymptotes.

50. $f(x) = \dfrac{x^2 - 2x + 1}{x^3 + x - 7}$

51. $f(x) = \dfrac{5x^3 - 2x^2 + 8}{4x - 3x^3 + 5}$

52. $f(x) = \dfrac{4x^2}{3x^2 - 7}$

53. $f(x) = \dfrac{(2x-5)^2}{x^2 - x}$

54. $f(x) = \dfrac{-3x + 1}{\sqrt{x^2 + x}}$ * Remember $\sqrt{x^2} = \pm x$

This is very important in the use of limits.

13

EXPONENTIAL FUNCTIONS

Example: Solve for x

$$4^{x+1} = \left(\frac{1}{2}\right)^{3x-2}$$

$$\left(2^2\right)^{x+1} = \left(2^{-1}\right)^{3x-2} \qquad \text{Get a common base}$$

$$2^{2x+2} = 2^{-3x+2} \qquad \text{Simplify}$$

$$2x+2 = -3x+2 \qquad \text{Set exponents equal}$$

$$x = 0 \qquad \text{Solve for x}$$

Solve for x:

55. $3^{3x+5} = 9^{2x+1}$

56. $\left(\frac{1}{9}\right)^x = 27^{2x+4}$

57. $\left(\frac{1}{6}\right)^x = 216$

LOGARITHMS

The statement $y = b^x$ can be written as $x = \log_b y$. They mean the same thing.

REMEMBER: A LOGARITHM IS AN EXPONENT

Recall $\ln x = \log_e x$

The value of e is 2.718281828... or $\lim\limits_{x \to \infty} \left(1 + \frac{1}{x}\right)^x$

Evaluate the following logarithms

58. $\log_7 7$

59. $\log_3 27$

Example: Evaluate the following logarithms

$\log_2 8 = ?$

In exponential for this is $2^? = 8$
Therefore $? = 3$
Thus $\log_2 8 = 3$

60. $\log_2 \dfrac{1}{32}$

61. $\log_{25} 5$

62. $\log_9 1$

63. $\log_4 8$

64. $\ln \sqrt{e}$

65. $\ln \dfrac{1}{e}$

14

PROPERTIES OF LOGARITHMS

$\log_b xy = \log_b x + \log_b y$	$\log_b \dfrac{x}{y} = \log_b x - \log_b y$	$\log_b x^y = y \log_b x$	$b^{\log_b x} = x$

Examples:

Expand $\log_4 16x$	Condense $\ln y - 2\ln R$	Expand $\log_2 7x^5$
$\log_4 16 + \log_4 x$	$\ln y - \ln R^2$	$\log_2 7 + \log_2 x^5$
$2 + \log_4 x$	$\ln \dfrac{y}{R^2}$	$\log_2 7 + 5\log_2 x$

Use the properties of logarithms to evaluate the following

66. $\log_2 2^5$

67. $\ln e^3$

68. $\log_2 8^3$

69. $\log_3 \sqrt[5]{9}$

70. $2^{\log_2 10}$

71. $e^{\ln 8}$

72. $9\ln e^2$

73. $\log_9 9^3$

74. $\log_{10} 25 + \log_{10} 4$

75. $\log_2 40 - \log_2 5$

76. $\log_2 \left(\sqrt{2}\right)^5$

EVEN AND ODD FUNCTIONS

Recall:
Even functions are functions that are symmetric over the y-axis.
   To determine algebraically we find out if $f(x) = f(-x)$
   (*Think about it what happens to the coordinate $(x, f(x))$ when reflected across the y-axis*)

Odd functions are functions that are symmetric about the origin.
   To determind algebraically we find out if $f(-x) = -f(x)$
   (*Think about it what happens to the coordinate $(x, f(x))$ when reflected over the origin*)

State whether the following graphs are even, odd or neither, show ALL work.

77. _____

78. _____

79. _____
$$f(x) = 2x^4 - 5x^2$$

80. _____
$$g(x) = x^5 - 3x^3 + x$$

81. _____
$$h(x) = 2x^2 - 5x + 3$$

82. _____
$$j(x) = 2\cos x$$

83. _____
$$k(x) = \sin x + 4$$

84. _____
$$l(x) = \cos x - 3$$

16
